# Use case - 3DS payment (direct)

Content

3DS Payment in direct mode

3D Secure payment is done in two steps:

- Card enrollment verification to 3D Secure system and authentication.
- Payment request.

Integration

You must use verifyEnrollment and doAuthorization web services of the Payline API.

Steps :

1. The consumer validates his cart shopping and fill the payment data to check enrollment by merchand request;
2. The merchant redirects the consumer to the bank's authentication page;
3. The merchant can then make a payment request with the authentication information with service doAuthorization;
4. The merchant must retrieve transaction information with the getTransactionDetails service.

API services
