[Step 2 : doAuthorization with 3D Secure settings](#)  
[Back Office](#)  
[3D Secure payment scheme](#)

---

## Introduction

### What is 3DSecure ?

The 3DSecure process adds a security layer to an online purchase: the buyer will usually validate his payment by entering a one-time passcode provided by their bank via text message. Other methods also exist. When a transaction is authenticated with 3DSecure, the liability in case of a subsequent chargeback is borne by the issuing bank. This is referred to as the principle of liability shift.

Payline holds Visa and Mastercard International (MCI) 3DSecure certifications.

### Subscription

The merchant gets a 3DSecure Distance Selling contract with their bank and sends the details to Payline.  
Payline registers the 3DSecure contract with Visa and MCI then activates the contracts. Allow up to ten working days for activation.

### Prerequisites for using Payline payment solution

The 3DSecure solution in Direct interface mode ensures the secure transfer of sensitive data and processes authentication and authorization requests.

Integration points :

- [verifyEnrollment](#) is required to provide authentication and [doAuthorization](#) to perform the authorization;
- get the result of the transaction with [getTransactionDetails](#).

You must check the [service access key](#) and configure the [SOAP UI](#).

## 3D-Secure in Direct Interface mode with a payment

The following steps present [verifyEnrollment](#) and [doAuthorization](#) web services for realizing 3DSecure transactions using the Direct interface.

### Step 1 - verifyEnrollment

This first call is to verify the eligibility of the card to a 3DSecure authentication, and therefore to know if the cardholder is registered with a VISA or Mastercard Directory Server. This is done with the [verifyEnrollment](#) web service.

Example of a request and response for the [verifyEnrollment](#) web service :

verifyEnrollmentRequest (VEReq)	verifyEnrollmentResponse (VERes)
---------------------------------	----------------------------------

<pre> &lt;impl:verifyEnrollmentRequest&gt; &lt;impl:card&gt; &lt;obj:number&gt;497010000325734&lt;/obj: number&gt; &lt;obj:type&gt;CB&lt;/obj:type&gt; &lt;obj:expirationDate&gt;0912&lt;/obj: expirationDate&gt; &lt;obj:cvx&gt;123&lt;/obj:cvx&gt; &lt;/impl:card&gt; &lt;impl:payment&gt; &lt;obj:amount&gt;4050&lt;/obj:amount&gt; &lt;obj:currency&gt;978&lt;/obj:currency&gt; &lt;obj:action&gt;100&lt;/obj:action&gt; &lt;obj:mode&gt;CPT&lt;/obj:mode&gt; &lt;obj:contractNumber&gt;CB3DS&lt;/obj: contractNumber&gt; &lt;/impl:payment&gt; &lt;impl:orderRef&gt;REF0923847&lt;/impl:orderRef&gt; &lt;/impl:verifyEnrollmentRequest&gt; </pre>	<pre> &lt;verifyEnrollmentResponse&gt; &lt;result&gt; &lt;code&gt;03000&lt;/code&gt; &lt;shortMessage&gt;ACCEPTED&lt;/shortMessage&gt; &lt;longMessage&gt;Operation Successfull&lt;/longMessage&gt; &lt;/result&gt; &lt;actionUrl&gt;<a href="https://acs.modirum.com/mdpayacs/pareq">https://acs.modirum.com/mdpayacs/pareq</a>&lt;/actionUrl&gt; &lt;actionMethod&gt;POST&lt;/actionMethod&gt; &lt;pareqFieldName&gt;PaReq&lt;/pareqFieldName&gt; &lt;pareqFieldValue&gt; eJxVkdтуwјAMhl+l4gGaA21ZkcnEOGhIYzAYQ9rNFFoPKq ClScvh7ZeUMrbcxJ9jx/ZveN8oxP4co1KhgDFqLdfoJHgnw XgrpM2QNQRMuзPMBRxR6SRLBXOpу4Hc0GSpaCPTQoCM 8qfRq2C86fkBkBphj2rUF+x6gFwRUrlH0e1NnRiPQCqCKCv TQl0E9ymQG0CpdmJTFIc2IafTyV1n2XqH7rciGqUp/Zh3TM TXKiuLJC9RA7EJQ059TUtraVPgnMRivPgMjkt/uNoO5Xzrl 5OBz5eDj5fZ8K0DxEZALAsUnJp2KQ8cGrY5a3tmosoPcm8 7E4PFzPGoa1utPXCwhbpX8Kh9+esBo7LCNLqlsPVg5rsR4 PmQpWgijKy/NsSolzNGfd1n6D1bpaPCiNikldBJXXF9qfES MY4DauvLACxGaTelqmXbKx/y/8Ba4usNQ==  &lt;/pareqFieldValue&gt;  &lt;termUrlName&gt;TermUrl&lt;/termUrlName&gt; &lt;termUrlValue&gt; <a href="https://acs.modirum.com/mdpayacs.php">https://acs.modirum.com/mdpayacs.php</a> &lt;/termUrlValue&gt; &lt;mdFieldName&gt;MD&lt;/mdFieldName&gt; &lt;mdFieldValue&gt;1Fz9nEnAZJNn8NvXEKDT&lt;/mdFieldValue&gt; &lt;/verifyEnrollmentResponse&gt; </pre>
--	--

Once enrolment has been confirmed, an authentication call to the ACS server can be initiated. Information received from the verifyEnrollmentResponse must be sent to the authentication server.

## Sending information

To send this information :

- in POST : create an HTML form,
- in GET : create a link.

**POST** : The data information will be sent to the authentication server via the form below.  
The field names and values are dynamically retrieved from the verifyEnrollmentResponse :

- Payment session:
  - mdFieldName = **MD**
  - mdFieldValue = **1Fz9nEnAZJNn8NvXEKDT**
- Authentication request:
  - pareqFieldName = **PaReq**
  - pareqFieldValue = **eJxVkdтуwјAMhl+l4gGaA...**
- Authentication address server. This address must retrieve a form sent in POST.
  - termUrlName = **TermUrl**
  - termUrlValue = <https://acs.modirum.com/mdpayacs.php>

Sample HTML form to perform a test on your server:

<b>HTML form</b>
<pre> &lt;form name="downloadForm" action="<a href="https://acs.modirum.com/mdpayacs/pareq">https://acs.modirum.com/mdpayacs/pareq</a>" method="POST"&gt;  &lt;input type="hidden" name="TermUrl" value="http://127.0.0.1/3DSecure/receive_form.php"&gt; PAREQ : &lt;input type="text" name="PaReq"&gt; &lt;br /&gt; MD : &lt;input type="text" name="MD"&gt; &lt;br /&gt; &lt;input type="submit" name="submit" value="Submit"&gt; &lt;/form&gt; </pre>

## Receipt of information returned during authentication

The authentication server sends its message to the URL entered in the TermURL parameter (sent in the previous form). In the response form, two fields must be retrieved to continue the transaction in 3DSecure mode:

- The MD field: always the same field allowing the follow-up of the session
- the Payer Authentication Response (PaRes) field: an encrypted string containing the response of the authentication server. The value of the PaRes field will validate or not the transaction as a 3DSecure transaction.

These two fields are retrieved and allow to complete the doAuthorizationRequest in 3DSecure mode.

Sample script (here written in PHP) to retrieve the response to authentication :

**Script PHP : receive\_form.php**

```
<?php
$pares = $_POST['PaRes'];
$md = $_POST['MD'];

echo "MD : ".$md."<br />PARES :
".$pares;
?>
```

Note: This script must be placed on a started web server and in a folder corresponding to the address sent via the TermURL field.

Example: if the server is local it is quite possible to put as value:

TermURL = [http://127.0.0.1/3DSecure/receive\\_form.php](http://127.0.0.1/3DSecure/receive_form.php)

## Step 2 : doAuthorization with 3D Secure settings

The doAuthorization service allows you to perform the transaction with the 3DSecure parameters.

The parameters provided : md / pares permit to check user authentication and thus the user identity before carrying out the transaction.

If the parameters are correct, the transaction is carried out as authorization request.

**doAuthorizationRequest**

**doAuthorizationResponse**

<pre> &lt;impl:doAuthorizationRequest&gt; &lt;impl:payment&gt; &lt;obj:amount&gt;4150&lt;/obj:amount&gt; &lt;obj:currency&gt;978&lt;/obj:currency&gt; &lt;obj:action&gt;100&lt;/obj:action&gt; &lt;obj:mode&gt;CPT&lt;/obj:mode&gt; &lt;obj:contractNumber&gt;CB3DS&lt;/obj:contractNumber&gt; &lt;/impl:payment&gt; &lt;impl:card&gt; &lt;obj:number&gt;4970105512345674&lt;/obj:number&gt; &lt;obj:type&gt;CB&lt;/obj:type&gt; &lt;obj:expirationDate&gt;0912&lt;/obj:expirationDate&gt; &lt;obj:cvc&gt;123&lt;/obj:cvc&gt; &lt;/impl:card&gt; &lt;impl:order&gt; &lt;obj:ref&gt;REF023493&lt;/obj:ref&gt; &lt;obj:country&gt;FR&lt;/obj:country&gt; &lt;obj:taxes&gt;100&lt;/obj:taxes&gt; &lt;obj:amount&gt;1400&lt;/obj:amount&gt; &lt;obj:currency&gt;978&lt;/obj:currency&gt; &lt;obj:date&gt;28/01/2009 09:32&lt;/obj:date&gt; &lt;/impl:order&gt; &lt;impl:buyer&gt; &lt;obj:lastName&gt;Dupond&lt;/obj:lastName&gt; &lt;obj:firstName&gt;Wilfried&lt;/obj:firstName&gt; &lt;obj:email&gt;wilfried.dupond@yahoo.fr&lt;/obj:email&gt; &lt;/impl:buyer&gt; &lt;impl:authentication3DSecure&gt; &lt;obj:md&gt;xRtMifcy975D2EB3Zs8e&lt;/obj:md&gt; &lt;obj:pares&gt; eJzFV2mTok0W/Ssd/T4a3ewKHZQq8LT8uWh9v0X8C9X 9dnSvZpwiZxtkQnR4/vcxQo0vM1a4/l9R/BFjkEQryXL4 NU12Tb4MZVE1L1+PbVv/QJC+77/3xPfzNUWmgFEEZZ k6R9fX0cle6U6nJcsH1bnKovDlruH7bTYMGmP5/2X9wl 2H14xxBT5b5PbbzFGVt8eCEo8aYT83umHcP/OLJ8Dvzb YYYo8JPjasmZySB7LnHxxTOX16x8SC1kadK0/86Mb7N DmzwLW7JsXdOgDbKqGt0MWzXUzHgfeTiJHYyXt3Gvli  LP+N9W4D2XV0MrIQkUn+/iOLJrhOdX5t6je0MVLvrO6/ +UWwynOS9H7sYGAZ5U3lbmDcT3ZMMEcjDfJb20VxhTw  bWgWEOt2Ix04i1tmBAuFHx2aEgzgEtcaJzh8TLbsXbpj4r  ..... &lt;/obj:pares&gt; &lt;obj:xid/&gt; &lt;obj:eci/&gt; &lt;obj:cavv/&gt; &lt;obj:cavvAlgorithm/&gt; &lt;obj:vadsResult/&gt; &lt;/impl:authentication3DSecure&gt; &lt;/impl:doAuthorizationRequest&gt; </pre>	<pre> &lt;doAuthorizationResponse&gt; &lt;result&gt; &lt;code&gt;00000&lt;/code&gt; &lt;shortMessage&gt;ACCEPTED&lt;/shortMessage&gt; &lt;longMessage&gt;Transaction approved&lt;/longMessage&gt; &lt;/result&gt; &lt;transaction&gt; &lt;id&gt;90217095220928&lt;/id&gt; &lt;date&gt;17/02/09 09:52&lt;/date&gt; &lt;isDuplicated&gt;0&lt;/isDuplicated&gt; &lt;isPossibleFraud&gt;0&lt;/isPossibleFraud&gt; &lt;fraudResult/&gt; &lt;explanation/&gt; &lt;threeDSecure&gt;Y&lt;/threeDSecure&gt; &lt;score/&gt; &lt;/transaction&gt; &lt;authorization&gt; &lt;number&gt;A55A&lt;/number&gt; &lt;date&gt;17/02/09 09:52&lt;/date&gt; &lt;/authorization&gt; &lt;/doAuthorizationResponse&gt; </pre>
--	---

## Back Office

Menu 'Technical follow-up of webservice calls' to find the call of the web service verifyEnrollment allows to see the details of the verifyEnrollment.

The result of the 3DSecure transaction is then visible in the Payline Administration Center: on the results of a search and in the detail of the transaction 3DSecure tab.

Screen searches for transactions:

## 3D Secure payment scheme

- The consumer validates his cart shopping then the merchant prepares web page to where will be filled the payment data.  
A VEReq (Verification Enrollment Request) message allows access to Directory Server to verify cart registration in the directory containing cards declared "enlisted" 3-D Secure and provide ACS URL.  
Verification enrollment response containing authentication result, that will be returned to Merchant Plug-in (MPI) to manage the dialogue with Directory and ACS to allow the buyer to authenticate.
- The merchant redirects the consumer to ACS URL for authentication.  
The request "PAREq" (Payer authentication request) allows access to bank ACS to trigger the authentication phase.  
The response "PARes" (Pay authentication response), containing the authentication result of cardholder will be transmitted to the merchant.
- The merchant can trigger a request for authorization and payment validation by calling service doAuthorizationRequest.
- The merchant retrieves details transaction by calling service getTransactionDetails.
